

Difficulties with decision making after brain injury

Headway's publications are all available to freely download from the [information library](#) on the charity's website, while individuals and families can request hard copies of the booklets via the [helpline](#).

Please help us to continue to provide free information to people affected by brain injury by making a donation at www.headway.org.uk/donate. Thank you.

Acknowledgements: many thanks to Dr Andrew Bateman, Clinical Manager, Oliver Zangwill Centre for Neuropsychological Rehabilitation and Prof Jonathan Evans, Professor of Applied Neuropsychology, University of Glasgow, for their contribution to this factsheet.

Introduction

Everyday life is full of situations in which we have to make decisions. Some of these decisions are minor, such as what toothpaste we will buy or what we will have for dinner, while others are major, such as whether we choose to stay in a relationship or how we decide to manage our finances.

Having difficulties with making decisions is a common problem after brain injury. A brain injury survivor may struggle with making both major and minor decisions, and therefore sometimes rely on family, friends, carers or professionals to make decisions on their behalf.

This factsheet is written to offer information and guidance to brain injury survivors, their friends and families, on managing difficulties with decision making.

What are decision making skills?

The ability to make decisions involves many different cognitive (thinking) skills. The mental skills that we use to make decisions are often referred to as 'executive functions'. It is our executive functions that allow us to deal with problems that arise in everyday life and to cope with new situations. More information on executive dysfunction is available in the factsheet [Executive dysfunction after brain injury](#).

Memory is a particularly important cognitive skill when making decisions, as it allows us to hold information so that we can think things through, as well as reflecting on choices that we have previously made. More information about the different types of memory that are involved in making decisions, as well as how this skill can be affected by brain injury, is available in the booklet [Memory problems after brain injury](#).

Emotions also help us to assess how important a decision is to us and how the possible outcomes will make us feel.

How decision making can be affected by brain injury

Decision making involves a lot of different processes, and this means that if any one of these processes is affected by brain injury, the ability to make decisions may be impaired.

People can be affected in different ways - some survivors may find it hard to make a decision at all, finding that even 'simple' decisions, such as what to wear, become very difficult to make. Some people become impulsive, making hasty decisions, apparently acting without thinking things through. Some people may find it difficult to think through the consequences of an action and so make decisions that are not in their best interest. Poor judgement in relationships, with money or in business can have devastating consequences for the brain injury survivor and their family.

Some survivors may make a decision and have a plan of action, but it can still be difficult for them to follow through with the plan. It is as if their intention, or goal, becomes neglected. This can sometimes be because they become distracted by other tasks or activities. They may 'forget' to do things, not because they have completely forgotten about what needs to be done, but rather that it is difficult for them to keep the task in mind, such as taking medication or passing on a message.

Self-awareness can also be affected by brain injury, so that the survivor is not aware of their problems. This is known as lack of insight. The survivor may fail to achieve important tasks, and others may consider their decisions as bad judgement. One of the first challenges to overcome is therefore related to the survivor achieving a degree of self-awareness and understanding of the problems they are experiencing. More information on lack of insight is available in the factsheet [Lack of insight after brain injury](#).

Tips for managing decision making difficulties after brain injury

Working out how to improve the ability to make decisions can be challenging. The first step in rehabilitation is understanding the problem, but with something as complex as decision making or problem solving difficulties this may not be straightforward, and may be best done with the help of a professional such as an occupational therapist, clinical psychologist or neuropsychologist. You can speak to your GP about getting a referral to a relevant therapist. The Headway helpline can also help with directing to therapists in private practice in your local area.

The following tips can help with improving decision making skills after brain injury.

Change the way you approach decision making

- **Stop: think!** For some people, improving decision making skills depends on the ability to override impulsive thoughts or behaviours. Developing a habit of often stopping to think about what you are doing, even just briefly, can help to interrupt a tendency to act without thinking. It is important to recognise when you are about to make a decision and tell yourself to 'stop: think!' to remind yourself to think through the decision you are about to make.
- Give yourself time - it may be that it is not easy to make decisions quickly after a brain injury, so try to ensure that you give yourself time to make a decision. Try not to rush a decision, even if you feel others are waiting for your decision about something. For important decisions, make sure you set some quiet time aside to think through your options and weigh up the pros and cons of them.
- Try not to make decisions when you are feeling tired or emotional, as being in such states will make it harder for you to think through information.
- If you are struggling to make a particular decision about something, try to identify what is causing you to have this difficulty. For instance, are there too many options available to you, or do you not have enough information about your options to feel confident in the decision you are making? Identifying such barriers might make it easier for you to reconsider how to approach the decision that needs to be made.
- Break larger decisions down into smaller, more manageable ones and tackle one decision at a time.

Plan in advance

- Talk yourself through a list of things that needs to be done and decisions you may need to make through the day. You could do this first thing in the morning and make a list that you can refer to through the day whenever you need reminders.
- Try not to leave decision making until the last minute. Write down any deadlines that you have coming up for important decisions that need to be made, for instance clearly marking dates on a calendar, and try to work towards making the decision well in advance.
- If you have time, write down the decision you have made and come back to it a few hours or days later to check that you still feel the same way about it.

Use tools to help

- Writing things down may help to make the advantages and disadvantages of the options you have clearer. It can help to write down the pros and cons of possible options that you are trying to decide between. Seeing things on paper can make it easier to choose between options than trying to hold all the information in mind.
- Use electronic devices such as mobile phones or smart watches. Diaries, notebooks, wall charts and calendars are also useful reminder tools.
- Boards that you can wipe such as whiteboards can be used to draw up and regularly update a weekly schedule for things you need to remember to do and decisions you need to make.
- Consider using audio recordings, pictures or photos to help with making decisions if you find it difficult to write lists or remembering information using words.

Seek advice

- Get advice from people you trust when making a decision. Family and friends can help with making minor day-to-day decisions, but can also help with personal major decisions such as whether or not to stay at a job or in a relationship.
- Seek legal advice from professionals such as solicitors when making major decisions such as managing your money.
- If you, or a family member or friend, are concerned about a survivor's capacity to make a decision and feel that decisions need to be made on their behalf for their own safety, seek support from the survivor's GP or a solicitor. More information about capacity and decision making is available in the booklet [*Mental capacity: supporting decision making after brain injury.*](#)
- If you feel you need professional support with your decision making difficulties, talk to your GP about getting a referral to an occupational therapist, clinical psychologist or neuropsychologist, who can offer Goal Management Training (a technique that helps people to better identify and remember their goals) or similar interventions to help.

Conclusion

Decision making is an important skill, and can difficulties with decision making after brain injury can impact on many aspects of life. It is hoped that the information in this factsheet has helped to identify some ways in which to manage decision making after brain injury, as well as where to seek support with this issue.

To discuss any issues raised in this factsheet, or to find details of our local groups and branches, please contact the Headway helpline free of charge on 0808 800 2244 (Monday - Friday, 9am-5pm) or by email at helpline@headway.org.uk.

You can also locate your nearest Headway group or branch by visiting www.headway.org.uk/supporting-you.

Please tell us how helpful this publication has been by filling in our short survey at www.surveymonkey.co.uk/r/hwpublications.
